MEDIA RELEASE

TF 1512 Front Hopper, The Multipurpose Seeding Solution

Coupled to seed drills, precision seed drills or tillage tools, the KUHN TF 1512 front hopper it is the versatile seeding solution.

The application rate is ensured by the metering unit with volumetric fluting. The VENTA system is capable of distributing seeds (crops and plant cover) as well as fertiliser without additional equipment. Electrically driven, the application rate can easily be adjusted during work.

The TF 1512 hopper can be coupled either to a wheeled front packer to level the ground between the tractor wheels, or to a carrying frame to preserve it.

The settings have been simplified by adding a calibration button near the metering unit to start the calibration test sequence without having to climb into the tractor cab.

This new front hopper is available in QUANTRON S2 version, as well as in ISOBUS version. In this latest version it is AEF-certified for the UT, TC Bas and TC SC functions.
